

About FTF International AG

FTF International AG, headquartered in Zurich, was founded in 2019. It bundles our previous activities in the field of face recognition and extends these to customer-specific solutions on the field of access control for office buildings, construction sites and production facilities. Our tailored solutions are GDPR compliant, contactless and can reduce the onsite labourcost up to 10%.

The best example is the integration between Nedap system and FTF technology which optimize physical access control via facial recognition. The integration supports enrollment of user's identity and authorize the access by creating a virtual badge into the AEOS access control system comparing a live image with the one associated to the badge. FTF solutions works in a connected or disconnected mode to negate any connectivity issues.

The system has data privacy at its heart and is set to be fully GDPR compliant. Users will first need to enroll to be able to use the system and all data collected

will be encrypted and securely stored. As part of this users will be made aware of the way their data will be processed and used while the system also allows data deletion upon request.

Wesley Keegstra, Integration manager at Nedap Security Management said;

“FTF managed to create a very flexible facial recognition solution. I was surprised by how hardware independent they are. They take a basic camera and use the live feed in their software to identify people. This is transferred to the Nedap AEOS access control system, where the person is authorized or not. Many thanks to the FTF team for all their effort, and for this great collaboration.”
